

## Laser Treatment Post Operative Instructions

### DO NOT RUB THE OPERATED EYE

Your vision may be blurry for 4 – 8 hours after the treatment. This is due to the dilated drops, the bright lights used during the laser treatment and the solution used to lubricate the contact lens used during the treatment.

You may have a foreign body sensation in the operated eye, some tearing and/or stickiness in that eye later in the day for the same reasons. Use warm compresses to draw out and stickiness you may feel after arriving home.

If you experience pain, redness or decrease/loss of vision, contact the office immediately.
